Grade	<b>10.00</b> out of 10.00 ( <b>100</b> %)

# Question **1**

Correct

Mark 1.00 out of 1.00

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of { 1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input:

64

Output:

4

Explanaton:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

Answer: (penalty regime: 0 %)

```
#include <stdio.h>
 2 v int main() {
        int denominations[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};
        int n = sizeof(denominations) / sizeof(denominations[0]);
4
        int value, count = 0;
scanf("%d", &value);
 5
6
7
        for (int i = 0; i < n; i++) {
             while (value >= denominations[i]) {
8 ,
9
                 value -= denominations[i];
10
                 count++;
11
12
        printf("%d",count);
13
14
        return 0;
15
16
```

Completed on	Tuesday, 22 October 2024, 1:55 PM
Time taken	23 mins 14 secs
Marks	1.00/1.00
Grade	<b>10.00</b> out of 10.00 ( <b>100</b> %)

```
Question 1
Correct
Mark 1.00 out of 1.00
```

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child i has a greed factor g[i], which is the minimum size of a cookie that the child will be content with; and each cookie j has a size s[j]. If s[j] >= g[i], we can assign the cookie j to the child i, and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number.

#### Example 1:

#### Input:

3

123

2

1 1

#### **Output:**

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

#### **Constraints:**

```
1 <= g.length <= 3 * 10^4
0 <= s.length <= 3 * 10^4
1 <= g[i], s[i] <= 2^31 - 1
```

Answer: (penalty regime: 0 %)

```
#include <stdio.h>
   #include <stdlib.h>
 2
 3 v int compare(const void *a, const void *b) {
        return (*(int *)a - *(int *)b);
 4
 5

```

Given an array of N integer, we have to maximize the sum of arr[i] \* i, where i is the index of the element (i = 0, 1, 2, ..., N). Write an algorithm based on Greedy technique with a Complexity O(nlogn).

Input Format:

First line specifies the number of elements-n

The next n lines contain the array elements.

Output Format:

Maximum Array Sum to be printed.

Sample Input:

5

25340

Sample output:

40

Answer: (penalty regime: 0 %)

```
#include <stdio.h>
 2
    #include <stdlib.h>
